

Figure 3.5.7. Optimising solutions to minimise the overlap of the MPA network solution with the activity of a single sector alters the network shape, substantially reduces the overlap with that sector, but considerably increases the overlap with other sectors. Each is optimised for a separate sector (indicated above) except the first map ('Combined') which was optimised for the activities of all sectors combined. Percentage overlap of the MPA network solution with sectoral activities is shown to the left of each map (as % overlap per sector).
